Subject: Mathematics

Student:

School year:/.....

Topic: Plane geometry

Areas and circumferences of geometric figures

What is a geometric figure?

- It is a geometric formation
- It has to be surrounded by a closed line, which is part of the figure too

What is circumference?

- We can understand it by the length of the borders of the figure
- Polygon is surrounded by a polygonal line, which is composed of line segments \overline{AB} so its circumference is a sum of the lengths of these line segments

INVESTICE DO ROZVOJE VZDĚLÁVÁNÍ

Gymnázium, Brno, Slovanské nám. 7

- In a case of circle, the circumference is the length of the circumference of the circle

What is an area?

- It is a plus number, it fits with a geometric figure which means that:
- Identical figures have the same circumferences
- If the circumference is composed of many figures, which do not overlap themselves, its circumference equals its sum of areas

Triangle

Circumference: $o = a + b + c$

Area: $S = 1/2av_a = 1/2bv_b = 1/2cv_c$

Heron's formula: $Area = \sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{a+b+c}{2}$

Rectangle

Circumference: $o=2(a+b)$

Area: $S=ab$

Square

Circumference: $o=4a$

Area: $S=a^2$

$$S=1/2e^2$$

Rhomboid

Circumference: $o=2(a+b)$

Area: $S=av_a=bv_b$

Rhomb

Circumference: $o=4a$

Area: $S=av$

$$S=1/2ef$$

Trapeze

Circumference: $o = a + b + c + d$

Area: $S = \frac{1}{2}(a+b)v$

Circle

Diameter: $d = 2r$

Circumference: $o = 2\pi r = \pi d$

Area: $S = \pi r^2 = \frac{1}{4}\pi d^2$

Annular area

Diameter: $d_1 = 2r_1$

$d_2 = 2r_2$

Area: $S = \pi(r_1^2 - r_2^2)$ $S = \frac{1}{4}\pi(d_1^2 - d_2^2)$

Quadrilaterals – vocabulary review

kite	A quadrilateral with exactly two distinct pairs of adjacent congruent sides.
rhombus	A quadrilateral with parallel opposite sides
diagonal	A segment joining two nonconsecutive vertices of a polygon.
square	A parallelogram with four right angles.
trapezoid	A quadrilateral with exactly one pair of parallel opposite sides.
rectangle	A parallelogram with four congruent sides.
median	A parallelogram with four congruent sides and four right angles.
parallelogram	A segment that joint the midpoints of the leg sof a trapezoid
isosceles trapezoid	A quadrilateral with exactly one pair of parallel sides and exactly one pair of congruent sides

TRIANGLES

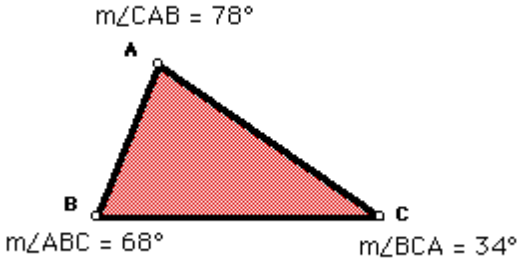

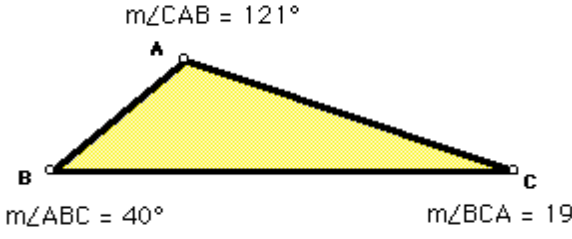

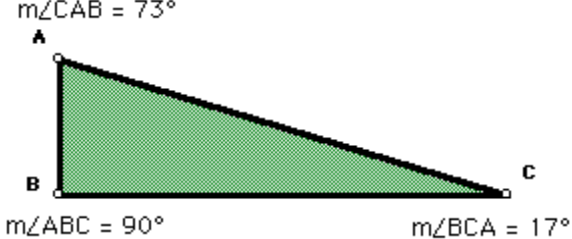

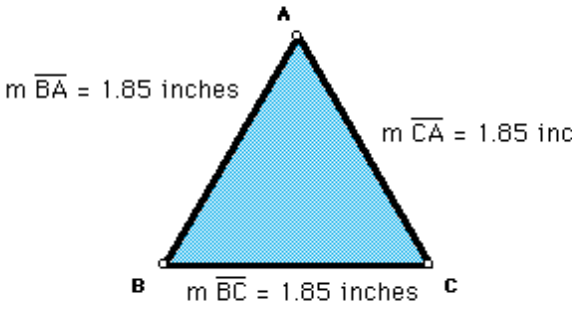

A **triangle** is one of the basic shapes of geometry: a polygon with three corners or vertices and three sides or edges which are line segments. A triangle with vertices A , B , and C is denoted $\triangle ABC$.

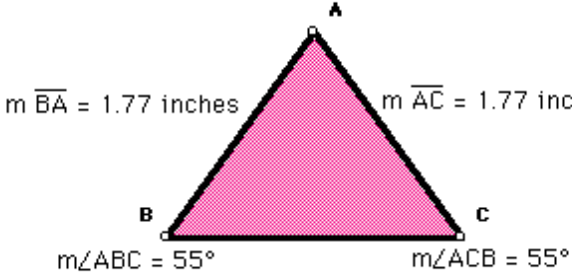

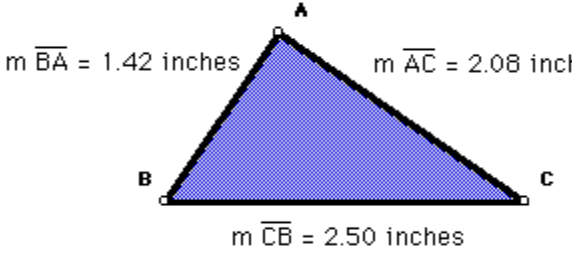

In Euclidean geometry any three non-collinear points determine a unique triangle and a unique plane

There are many different kinds of triangles.

The following table outlines some basic types of triangles.

 <p> $m\angle CAB = 78^\circ$ $m\angle ABC = 68^\circ$ $m\angle BCA = 34^\circ$ </p>	<p>Acute triangles are triangles in which the measures of all three angles are less than 90 degrees.</p>
 <p> $m\angle CAB = 121^\circ$ $m\angle ABC = 40^\circ$ $m\angle BCA = 19^\circ$ </p>	<p>Obtuse triangles are triangles in which the measure of one angle is greater than 90 degrees.</p>
 <p> $m\angle CAB = 73^\circ$ $m\angle ABC = 90^\circ$ $m\angle BCA = 17^\circ$ </p>	<p>Right triangles are triangles in which the measure of one angle equals 90 degrees.</p>
 <p> $m\overline{BA} = 1.85 \text{ inches}$ $m\overline{CA} = 1.85 \text{ inc}$ $m\overline{BC} = 1.85 \text{ inches}$ </p>	<p>Equilateral triangles are triangles in which all three sides are the same length.</p>

 <p>$m \overline{BA} = 1.77$ inches $m \overline{AC} = 1.77$ inches $m \angle ABC = 55^\circ$ $m \angle ACB = 55^\circ$</p>	<p>Isosceles triangles are triangles in which two of the sides are the same length.</p>
 <p>$m \overline{BA} = 1.42$ inches $m \overline{AC} = 2.08$ inches $m \overline{CB} = 2.50$ inches</p>	<p>Scalene triangles are triangles in which none of the sides are the same length.</p>

Some Definitions

vertex of a triangle: the point at which two sides of a triangle meet.

altitude of a triangle: the perpendicular segment from a vertex of a triangle to the line containing the opposite side.

base of a triangle: the side of a triangle to which an altitude is drawn.

height of a triangle: the length of an altitude.
